Corrosion is a galvanic process that can be prevented using cathodic protection. The deterioration of metals through oxidation is a galvanic process called corrosion. Protective coatings consist of a second metal that is more difficult to oxidize than the metal being protected.

To be an effective corrosion site, the crevice must be wide enough to allow the corroding electrolyte in and then provide 'stagnant' conditions. Crevice corrosion can therefore be a concern where gaps are a few micrometers wide, but there are no absolute or critical dimensions for crevices, below which corrosion is certain.

Article: Principles and prevention of crevice corrosion

Thus it is critical to use corrosion prevention methods and use Zavenir products to halt, stop and prevent corrosion in metals. The prevention can be done through cathodic protection where through using different currents the undesirable anodic sites on a metals surface is converted to cathodic destination. The next way is coating the metal.

Different Corrosion Prevention Method

Prevention of Corrosion Preventing corrosion is of utmost importance in order to avoid huge losses. Majority of the structures we use are made out of metals. This includes bridges, automobiles, machinery, household goods like window grill, doors, railway lines, etc.
